

I4D Intelligence for Decision

From strategic monitoring to operations planning and tactical implementation for Defence, Maritime and Civil applications.

I4D is a unique GEOINT solution to retrieve, visualise, analyse, merge and correlate heterogeneous / exogenous sources and data for geospatial analysis.

An easy to use expert tool

I4D is a powerful solution for geospatial analysis of multi-source data (IMINT, SIGINT, HUMINT, OSINT) and intelligence report production on one single interface.

It can be used across all levels of missions, from strategic intelligence for multi-INT analysis to tactical mission preparation.

Ensuring people protection

GEOINT analysts can use I4D for critical needs (e.g. terrorist threat analysis or border monitoring) by collecting satellite imagery and geo-data, analysing and fusing data layers on geographical views. I4D enables fast, up-to-date and informed decision-making thanks to intelligence reports ready for dissemination.

Various applications

I4D was developed in collaboration with the French Ministry of Defence and can be deployed as a stand-alone application. I4D also extends its usage to Air, Land and Navy as well as civil applications such as urban planning, pandemics, natural disasters and crisis management.

Tracking AIS at sea

Detecting and identifying vehicles

Key Features

- Interoperability with Fortion® Workflow, Fortion® CSD, Fortion® IKDB and Airbus or Customer's own Applications
- Compatibility with NATO STANAGs
- Report creation module
- Back-end data store with profile management and authorisation check
- Alerts on critical events and prediction of future route and location

Key Benefits

- **Accessibility:** expert tool, quick to learn
- **Time saving:** a single interface from collection to report production
- **Interoperability:** data compatible with OGC standards and other geospatial formats
- **Excellence:** accurate and up-to-date data
